Some Important Use Areas for Native American Tribes - DRAFT, December 7, 2007

The areas and uses identified on this map represent an approximation of some (not all) important tribal marine resource uses and coastal areas in the MLPA North Central Coast Study Region. The shoreline areas represented here were identified by Native American tribal members during a workshop held in Healdsburg, California on November 8, 2007. Tribal participants generated maps of important historical or current use areas and provided information for each identified area, such as the types of uses and specific marine resources gathered for personal or small-scale use (i.e., not commercial). The information collected from the workshop went through a structured validation process; only data that participants confirmed was accurate and that they were willing to make public are represented. It should be noted that there are other areas that are also important for tribal uses that are NOT shown on the maps; the location and use of some areas has not been provided by tribal members for cultural reasons. MLPA staff is working with tribal members to provide additional information on tribal uses of marine resources in the region. The data shown on this map was the best readily available information as of December 7, 2007.
